

COVID Myths

10 Unfounded Claims

Claim #1 : Natural Immunity Offers Little Protection Compared to Vaccinated Immunity

- 65 major studies in 19 countries on natural immunity prompted Lancet study researchers to conclude that natural immunity was at least as effective as the primary COVID vaccine series. [chart](#)

Claim #2 : Masks Prevent COVID Transmission

- A highly respected Oxford research team found that masks had no significant impact on COVID transmission. Yet, CDC Director Dr. Rochelle Walensky downplayed their review, arguing that it was flawed because it focused on randomized controlled studies (which, in actuality, are the gold standard for medical evidence).

Claim #3 : School Closures Reduce COVID Transmission

The CDC ignored the European experience of keeping schools open, most without mask mandates. Transmission rates were no different, evidenced by studies conducted in **Spain** and **Sweden**.

Claim #4 : Myocarditis From The Vaccine is Less Common Than From The Infection

- Public health officials downplayed concerns and discredited whistleblowers warning of vaccine-induced myocarditis. Well-designed studies proved that myocarditis is 6 to 28 times more common after the COVID vaccine than after the infection among 16-24-year-old males.

Claim #5 : Young People Benefit From A Vaccine Booster

- Boosters reduced hospitalizations in older Americans, but there was no evidence they reduced COVID deaths in young, healthy people. The CDC only published its data on hospitalization rates among boosted Americans over 50, but not for those under 50.

Claim #6 : Vaccine Mandates Increased Vaccination Rates

- Recent data proves vaccine mandates in nine major US cities had no impact on vaccination rates. They also had no impact on COVID transmission rates; yet, the mandates persist to this day, costing unvaccinated workers, nurses, soldiers, and others their jobs, regardless of their risk or natural immunity.

Claim #7 : The Wuhan Lab Theory is A Conspiracy Theory

- Google admitted to suppressing searches of “lab leak” during the pandemic. Dr. Francis Collins, head of the NIH, denies that the virus came from a lab; yet, overwhelming evidence points to a lab leak origin.

Claim #8 : Get The Second Vaccine Dose Three Or Four Weeks After the First Dose

- Data was cleared just weeks after the rollout, in the spring of 2021, that spacing the vaccine out by three months reduces complication rates and increases immunity.

Claim #9 : Data On The Bivalent Vaccine is ‘Crystal Clear’

- The bivalent vaccine was approved using data from eight mice. To date, there has never been a randomized controlled trial of the bivalent vaccine.

Claim #10 : 1 in 5 People Get Long COVID

- The normal weakness and fatigue, which can last for weeks after being sick and inactive and not eating well, may have been included in the CDC’s number, while the UK study revealed that such a claim was **unfounded**.

Food For Thought:

- Public health officials were not wrong for making recommendations based on the data that was available at any particular time. The **real** problems arose as they clung to their recommendations for so long after the data proved them wrong.
